

Freight and V2X

SigOps | Office of Traffic Operations
September 2021

V2X Framework

Safety and mobility applications achieved through multiple means. The application drives the method the data arrives to a user.

Close attention needs to be made to data quality, security, and accuracy - especially for data used for safety applications.

Applications Enabled

Emergency Vehicle Preemption

Demonstration in Gwinnett County of the use of V2X for emergency vehicle Preemption on a fire truck.

Freight Priority and Information

Equipping freight vehicles in Savannah to request signal priority and receive information regarding blocked at-grade rail crossings.

Transit Signal Priority

Pilot of Transit Signal Priority on Xpress buses in Midtown Atlanta using V2X.

Signal Phasing and Timing

Demonstration of red-light running and optimal green speed applications to inform drivers for improved safety and mobility.

Freight Applications

GPA Freight Signal Priority Pilot

- Installation of RSUs at signalized intersections around port ingress/egress routes
- Broadcasting SPaT and MAP, traveler information messages for road conditions
- Demonstration of freight signal priority
- Outfitting fleet vehicles

Example in-cab message

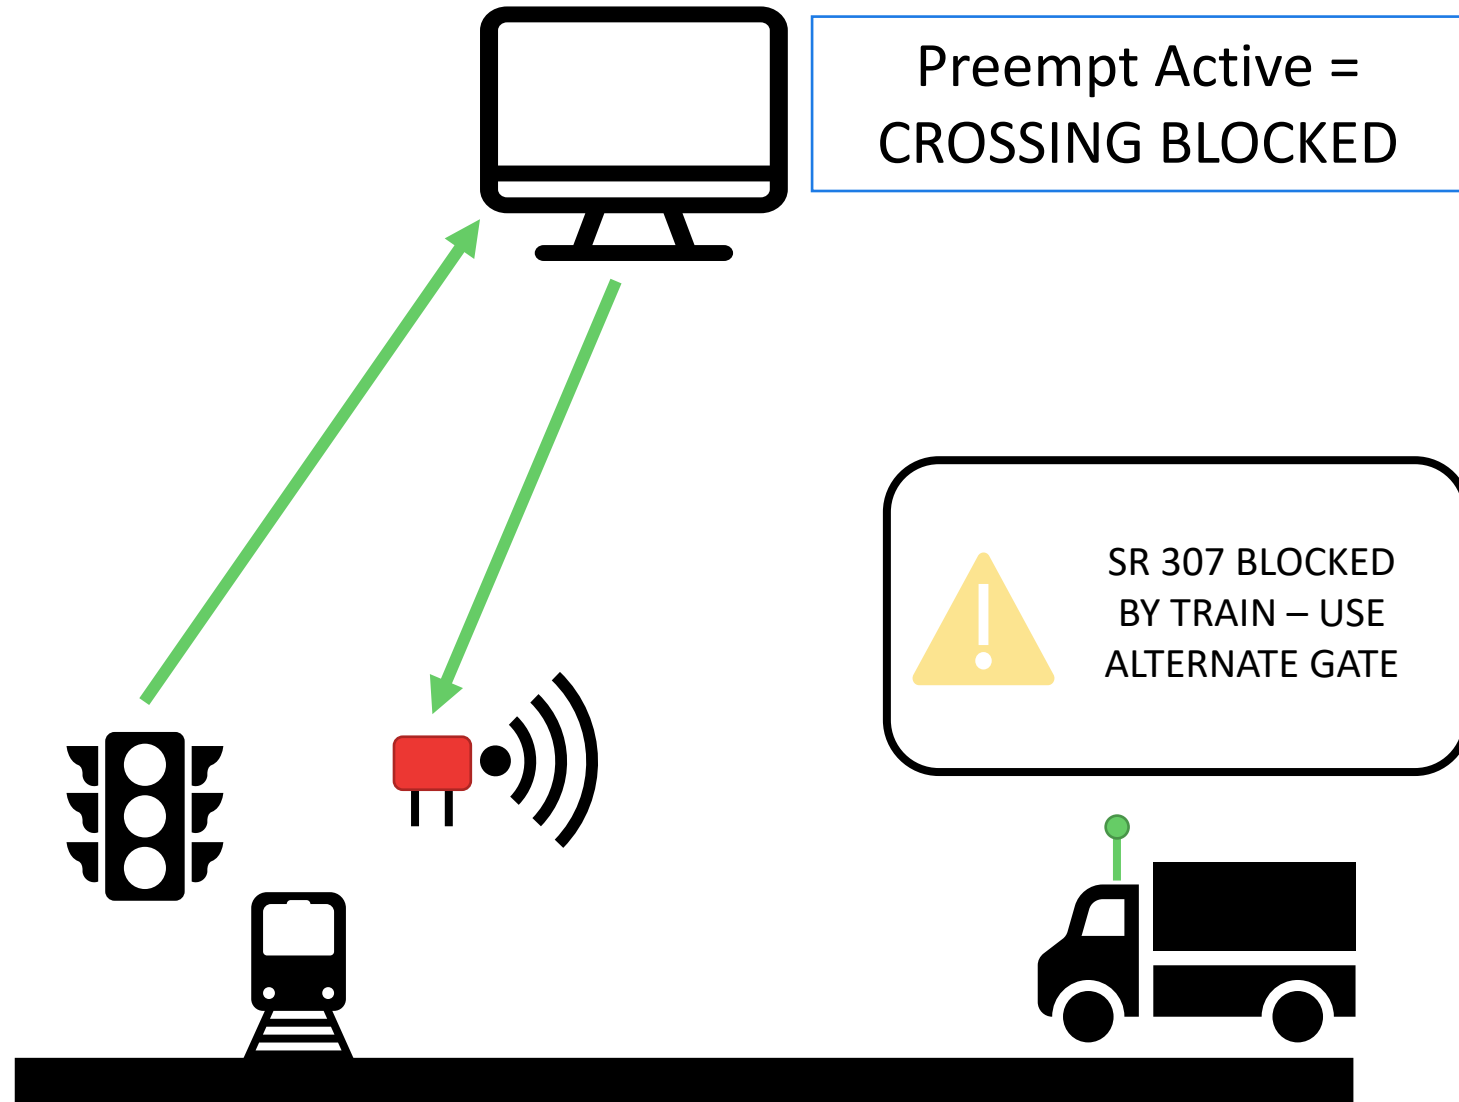

System Design

Existing signal infrastructure enters its preempt state when the railroad crossing gates are activated.

Central application listens for the preempt input at these intersections through API.

This input triggers the RSUs to broadcast a TIM message to select RSUs to provide information to drivers.

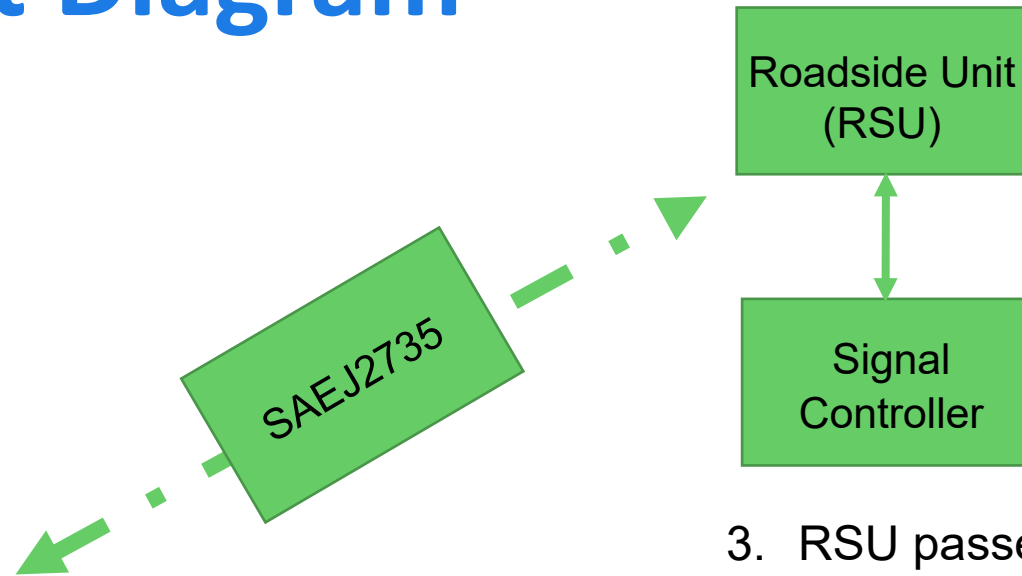

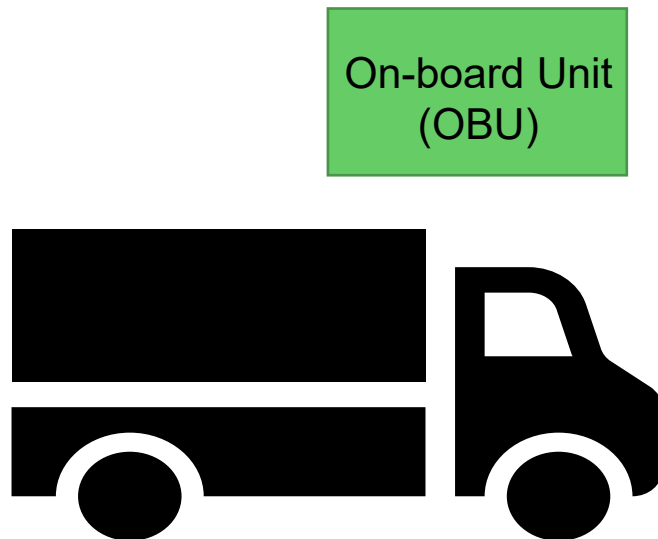

Signal Priority

V2X Component Diagram

1. Freight vehicle sends priority request to onboard unit (OBU) without condition.
2. OBU sends signal request message to roadside unit (RSU) wirelessly to request priority.

3. RSU passes priority request to the signal controller.
4. Signal controller uses built-in logic to assign (or not assign) priority based on operator defined parameters.
5. Signal and RSU pass signal status message back to OBU on truck of priority granted or not.

In-cab Equipment

On-board Unit (OBU).

On-Board Unit Specifications

- 130 x 120 x 35 mm
- Max power draw 8 W
- Typical power draw 5-6 W
- External antenna mounted through magnet or permanently (screwed in)

External antenna.

Portable OBU in the back of a GDOT vehicle.

Rearview mirror user interface example

HUD user interface example

Vendor (BrandMotion) examples of in-cab displays.

Example Traffic Signal Application Display

The screenshot shows a traffic signal application interface with the following elements and callouts:

- Phase service remaining:** Callout pointing to the number '10' in the top-left traffic light.
- Intersection name:** Callout pointing to 'SR141_Shadowlawn' in the center.
- Debug information:** Callout pointing to the right-hand data panel.
- Target Speed:** '10 MPH' displayed in the center.
- Vehicle speed:** '33 MPH' displayed next to a green vertical bar.
- Minimum speed required to clear green:** Callout pointing to the '10 MPH' target speed.

Debug Information Panel:

Timestamp:	40623
Intersection ID:	41701
Intersection Name:	SR141_Shadowlawn
Lane ID:	13
Current Speed:	335
Green Speed:	104
RLW:	-
Current State:	flashYellowLeftArrow
Countdown:	9
Current State:	greenBall
Countdown:	9

Outcomes and Performance Measurement

System Performance

Through the use of high-resolution traffic signal event data, the system is monitored for performance on a continual basis.

This data can measure the performance of both the priority system as well as its impact to intersection and corridor operations.

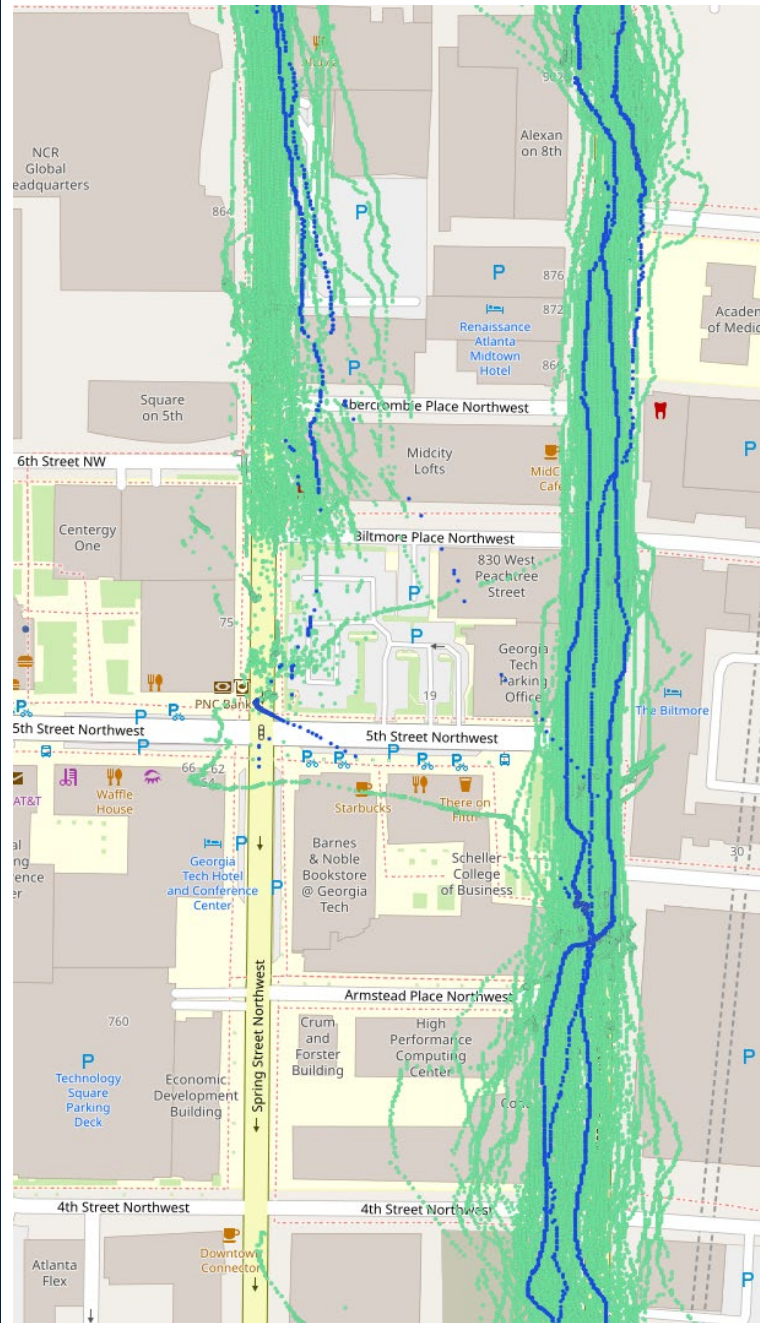

TimeStamp	DeviceId	SignalID	EventId	Event Descriptor
2021-04-13 07:46:55.7	2919	177	112	TSP Check In
2021-04-13 07:46:55.8	2919	177	113	TSP Adjustment to Early Green

Vehicle and RSU Performance

Logging of basic safety messages (BSMs) pulled from vehicles can measure the performance of V2X systems.

Travel times can be extrapolated from data to measure travel time improvements.

Things like positional accuracy and correction can be monitored and improved as needed.

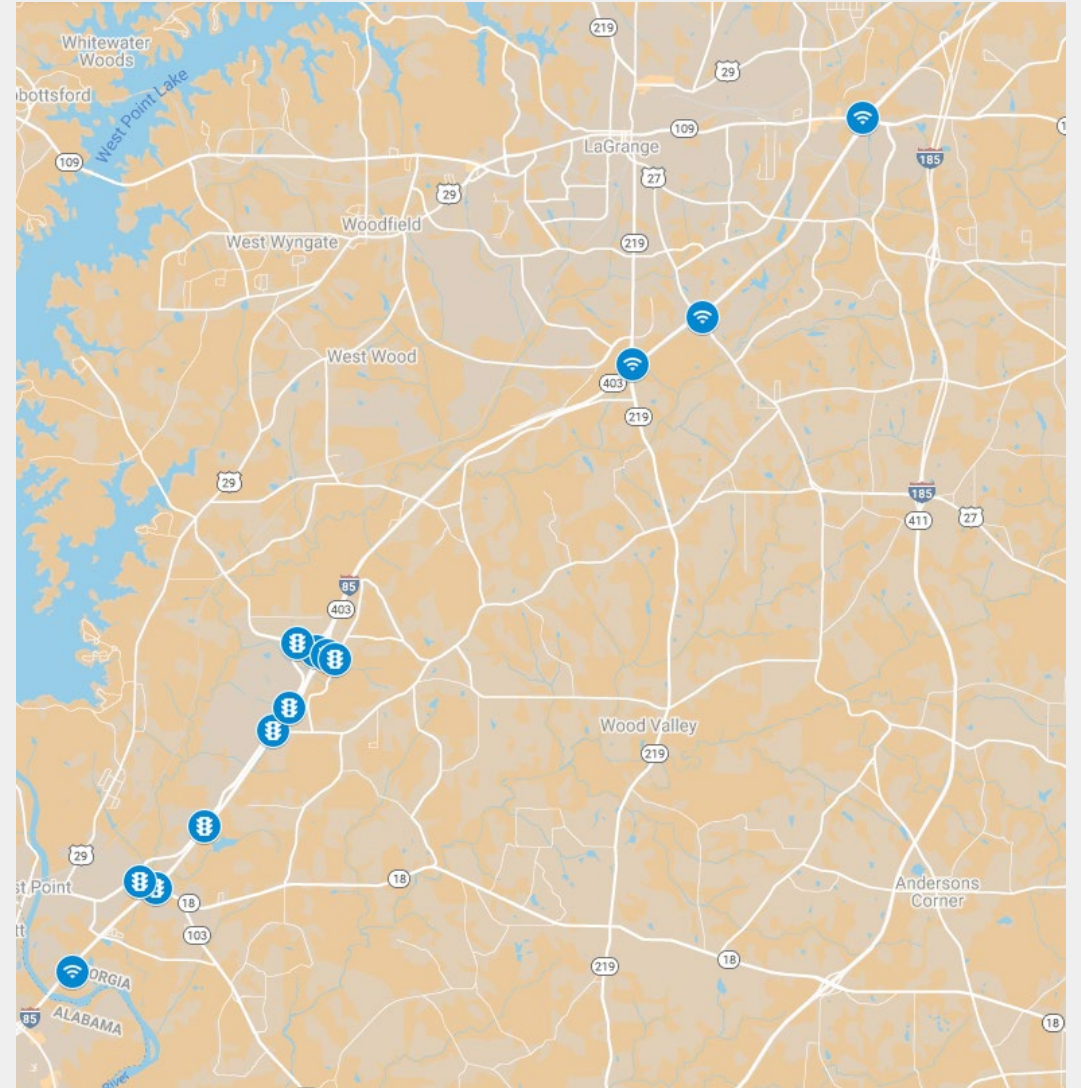

Expanded Use in Georgia

The Ray on I-85

- LTE-CV2X and DSRC RSUs deployed along 18 mile stretch of I-85
- Partnership with the Ray C. Anderson Foundation, Panasonic, and FHWA
- Demonstration of interstate safety applications
- Data platform (Cirrus) for BSM capture and analyzation
- 4 GDOT Vehicles equipped with LTE-CV2X OBUs
- Future partnerships and intersection deployments
- Kia vehicles now equipped with OBE and HID's

Additional Considerations

Thank You!
